

Parallel miss-ratio curves: measured against predicted

schedule(static, 1) · block size 1 element(s) · fully-associative LRU · uniform interleaving, seed 1 · 36 configurations · mean MAE 0.0249 (CRI model), 0.0300 (end to end) · scaled curve reuses one derivation at T = 4

— exact LRU (measured reuse distance) ··· CRI model (derived at this T)
— Denning (measured reuse interval) — CRI model (scaled from base T, no re-derivation)
